

# WEEKLY EPIDEMIOLOGIST REPORT

December 26, 2023

Christine DePierro-Gacek, MAT, MPH  
EPIDEMIOLOGIST, Central Connecticut Health District

## RESPIRATORY VIRAL SEASON

Respiratory Syncytial Virus (RSV) is still the most prevalent laboratory-confirmed virus circulating at this time, followed by SARS-CoV-2 (COVID-19) and influenza. Visit [www.ccthd.org](http://www.ccthd.org) for an interactive map on respiratory illness in our district. Remember, if you are sick stay home to prevent the spread of germs to others.

### COVID-19 SURVEILLANCE

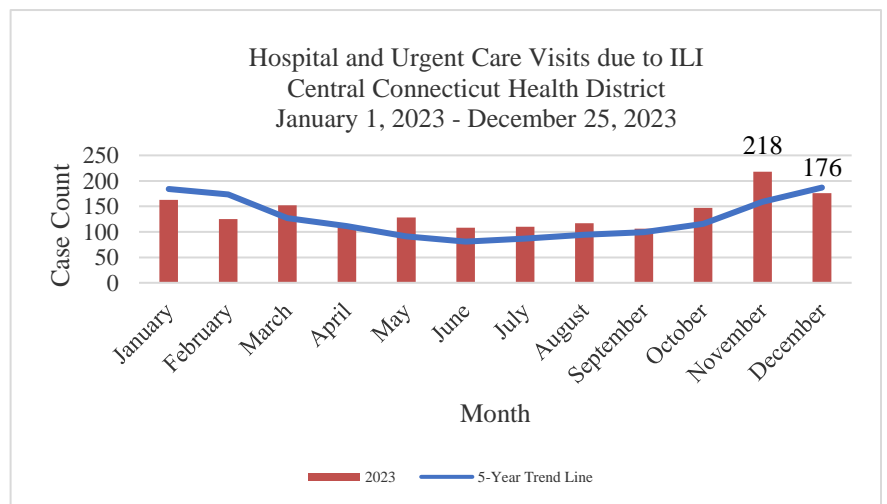

Data for COVID-19 is as of December 25, 2023 from EpiCenter. The bar graph below illustrates the syndromic surveillance of hospital and urgent care visits due to COVID-19 (those experiencing symptoms with a COVID-19 diagnosis) in our district. Ninety-four cases were reported between 12/19-12/25.

CCHD no longer has at-home COVID-19 test kits. Contact our Clinical Health Supervisor, Lisa Coakley, to make an appointment for a **FREE** rapid PCR test. Please call (860) 335-7158 or email [lcoakley@ccthd.org](mailto:lcoakley@ccthd.org). Our clinic is located at 506 Cromwell Avenue in Rocky Hill. For more information on clinic offerings, please visit: <https://www.ccthd.org/chs>

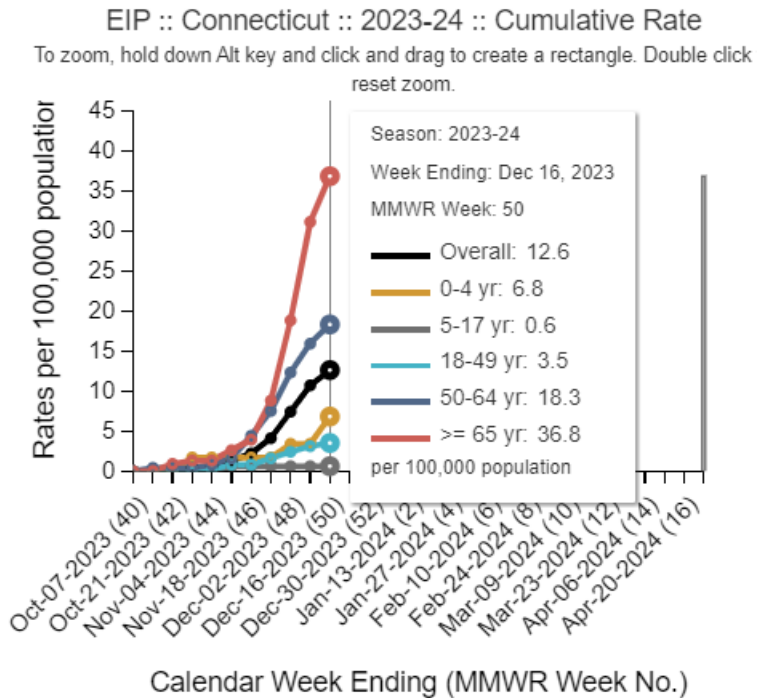

### INFLUENZA SURVEILLANCE

Data for Influenza-like Illness (ILI) is as of December 25, 2023 from EpiCenter. The graph on the following page illustrates the syndromic surveillance of hospital and urgent care visits due to ILI five-year average trend line (2018-2022) compared to this year's cases. Other circulating respiratory viruses can present as influenza-like illness. ILI is defined as having a fever and a cough or sore throat.

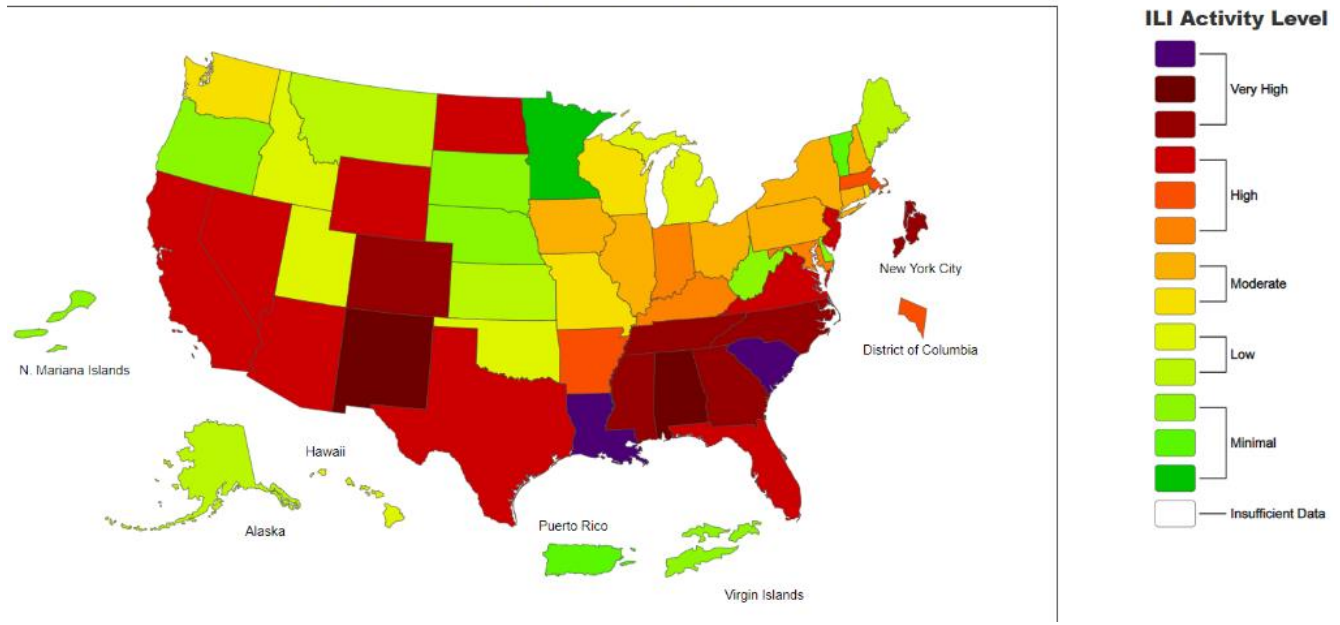

In Connecticut, the majority of those hospitalized with influenza are those who are 65 years of age or older (36.8 per 100,000 population) followed by those who are 50-64 years of age (18.3 per 100,000 population) and those who are 0-4 years of age (6.8 per 100,000 population). Data was last updated on December 16<sup>th</sup>. The figure to the right can be found at <https://gis.cdc.gov/GRASP/Fluview/FluHospRates.html>

The CDC’s FLUView Interactive Map <https://gis.cdc.gov/grasp/fluview/main.html> is a system that monitors visits for respiratory illness that includes fever plus a cough or sore throat (ILI), not laboratory-confirmed influenza and may capture patient visits due to other respiratory pathogens that cause similar symptoms. Connecticut’s ILI Activity Level is in the Moderate range. *We can expect to continue to see an increase in respiratory illness due to holiday travel and New Year gatherings and celebrations.*

2023-24 Influenza Season Week 50 ending Dec 16, 2023

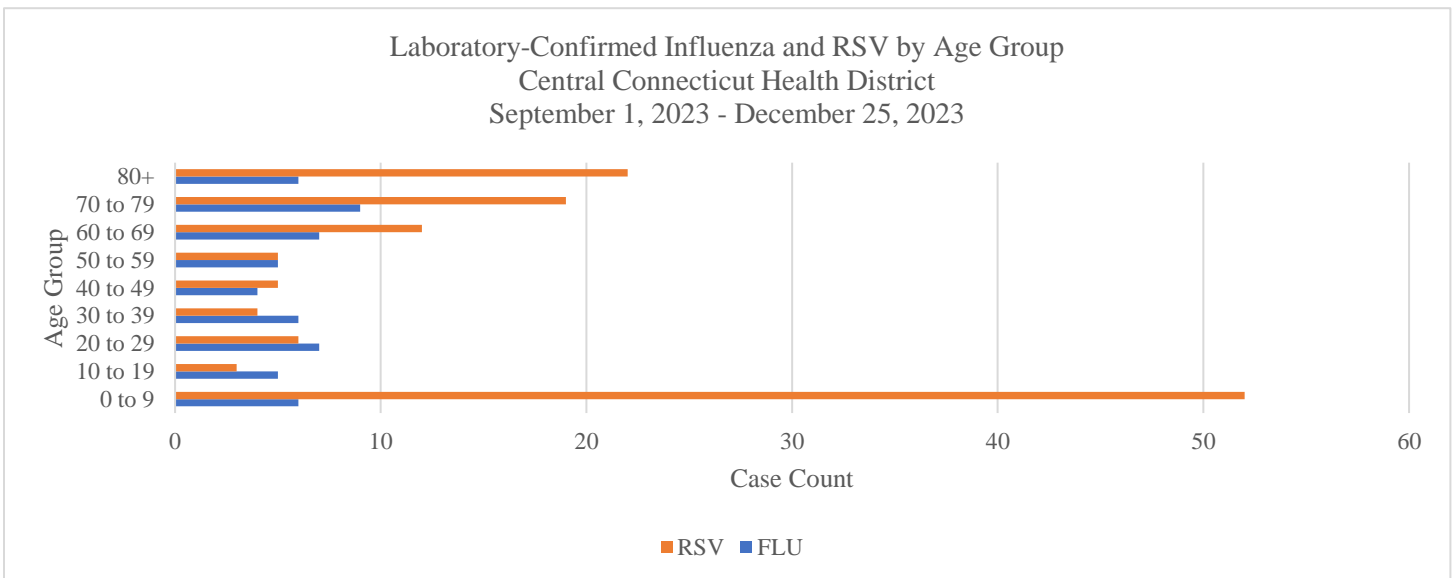

# RESPIRATORY SYNCYTIAL VIRUS (RSV)

Nationally, RSV antigen (blue line), viral isolation (red line) and PCR (purple line) percent positivity are elevated (line graph on left). Connecticut RSV PCR test positivity (red line) continues to increase as of December 21<sup>st</sup> (see bar graph to the right).

As of September 1, 2023, our district was notified of 55 (+15) laboratory-confirmed of influenza (98% influenza type A), and 128 (+45) laboratory-confirmed cases of RSV in the CTEDSS database (see figure to the right). The majority of laboratory-confirmed RSV cases were among children ages zero to nine years of age (41%) (see figure below) with most of them infants, ages 0 to 2 years of age, (78%).

## NATIONAL RESPIRATORY & ENTERIC VIRUS SURVEILLANCE SYSTEM (NREVSS)

The National Respiratory and Enteric Virus Surveillance System (NREVSS) is a laboratory-based system that monitors temporal and geographic circulation patterns (patterns occurring in time and place) of respiratory syncytial virus (RSV), human parainfluenza viruses (HPIV), human metapneumovirus (HMPV), respiratory adenoviruses, human coronavirus, and gastrointestinal viruses: rotavirus, and norovirus. Participating laboratories report weekly to CDC the total number of tests performed that week, and the number of those tests that were positive. Middlesex and Yale are the only contributing health organizations in Connecticut that report respiratory and enteric virus surveillance data to the CDC. Data from NREVSS was updated December 21, 2023.

### Norovirus test positivity remains high in the Northeast

(9.4%). The figure to the right illustrates the three week average percent positivity since December 21, 2021. CCHD will continue to conduct surveillance and report on significant trends. Norovirus is the leading cause of vomiting and diarrhea, and foodborne illness in the United States. People of all ages can get infected and sick with norovirus, which spreads very easily and quickly.

<https://www.cdc.gov/norovirus/about/prevention.html>

### Human Parainfluenza Virus (HPIV) Type 2 and Type 3

percent positivity has dropped below 5% positivity. HPIV-2 usually causes croup and can cause upper and lower respiratory illness, and cold-like symptoms. HPIV-3 is more often associated with bronchiolitis, bronchitis, and pneumonia.

Seasonal coronaviruses, adenovirus, rotavirus and human metapneumovirus detection data appear to show no concerning increases.

## BIOFIRE SYNDROMIC TRENDS

Biofire Syndromic Trends is a software feature from BioFire that provides pathogen circulation trends. BioFire is a syndromic infectious disease diagnostics company that provides healthcare providers with accurate and comprehensive results in a short period of time. <https://www.biofire.com/products/filmarray/biofire-syndromic-trends/>

The figure on the next page illustrates aggregate BioFire data for respiratory pathogen trends as of December 26, 2023. According to Biofire results, Coronavirus is the main pathogen patients are testing positive for at this time (16.7%, +7.8) on Biofire's respiratory panel test, with SARS-CoV-2 the dominate coronavirus circulating at 11.6%. Individuals in the US are also testing positive for Human Rhinovirus/Enterovirus pathogen (13.5%, - 1.7), followed by Influenza A (13.1%, -1.1) and RSV (10.1%, - 1.1).

Respiratory Pathogen Trends (RP2.1)

Area  Line

The figure below illustrates aggregate BioFire data for gastrointestinal (GI) pathogen trends as of December 26, 2023 for patients who were tested using Biofire’s GI panel test. Test positivity for diarrheagenic *E.coli/Shigella* (18.1%, +1.8) is the main GI pathogen found using Biofire’s GI panel, followed by *C. difficile* toxin A/B (17.1%, 0) and Norovirus (10.2%, +1.8).

Gastrointestinal Pathogen Trends

Area  Line

## PREVENTION

Not only are respiratory viruses circulating at this time, but gastrointestinal pathogens are as well. The best way to prevent the spread of infectious respiratory or gastrointestinal illness is to:

- Cover your cough and sneezes,
- **Wash your hands often,**
- Get vaccinated,
- Stay home when you are ill,
- Wear a mask in crowded places,
- Minimize close contact with sick people,
- Eat healthy, well-balanced meals, and
- Stay hydrated.

## FOOD RECALLS

The following foods are being recalled because they are contaminated. Please check your cupboards and throw out any of these items:

### **New this week:**

- Ground beef, Scanga Meat Company (*E. coli* 0103)

### **Previously reported:**

- Quaker Oats granola bars and cereals (potential for *Salmonella*). For more information please visit: <https://www.fda.gov/safety/recalls-market-withdrawals-safety-alerts/quaker-recalls-granola-bars-and-granola-cereals-due-possible-health-risk>
- Herolds Salads, INC., Deli Salads (*Listeria monocytogenes*)
- Nature's Wonder, Mung Bean Sprouts (*Listeria monocytogenes*)
- Fresh Express and Publix, Spinach (*Listeria monocytogenes*)

For more information on recalls due to undeclared allergens please visit: <https://www.fda.gov/safety/recalls-market-withdrawals-safety-alerts>
